

C# WPF Test

- Build a simple windowed (fixed pixel area) WPF image text overlay application in the **MVVM pattern** which does the following:
 - Allows a user to load an arbitrary sized .png image through a file browser
 - Displays the user selected image in a fixed viewing area in the application
 - Provides a text box for the user to provide an annotation that appears as an overlay on the image as the user types in the text box
- The application must not use any external library dependencies
